Disclosure: I have only read one of his books, I took a couple of philosophy courses in college but never studied the topic. In recent years, with the advance of information-oriented society, information/communication technology to be built in the vehicle has advanced as well, and various technologies have been developed for integration of, for example, communications functions and audio/video/navigation functions, in the vehicle. As a result, sophisticated vehicle electronics are now required to have advanced functions. The advanced vehicle

electronics have been replaced with a highperformance processor in the vehicle. Accordingly, the high-performance processor, in addition to processing the aforementioned advanced vehicle electronics, also processes various electrical control signals. Accordingly, the highperformance processor is equipped with numerous electric components such as a bypass capacitor and a resistor. Regarding the bypass capacitor, for example, a conventional bypass capacitor is in the shape of a plate-like member, and has a structure in which thin films are laminated. According to the conventional bypass capacitor, however, when thin film is laminated, an area of the capacitor is increased, and there is a concern about electrical resistance. Accordingly, in recent years, in the field of electronic device such as the high-performance processor, researches of a bypass capacitor in the shape of a belt-like member have been performed. That is, by laminating plural thin

films in a plane direction, a bypass capacitor is formed in the shape of a belt-like member, and the bypass capacitor is applied to a high-frequency circuit. By the use of the bypass capacitor in the shape of a belt-like member, a volume of the bypass capacitor is reduced. However, when a capacitor element is formed in the shape of a belt-like member, and other components such as a connector and an electric part are
